

Dataset Inspection Report

Project: Week 1 Customer Behaviour & Business Performance Analysis

Dataset: Telco Customer Churn

1. Data Loading & Structure

Observations: The dataset contains 7,043 individual customer records (rows).

Features: There are 21 original variables (columns) capturing customer demographics, account information, and subscribed services.

2. Data Cleaning & Transformation

Data Type Correction: The TotalCharges column was originally stored as a text data type. During the data cleaning steps executed via Power Query, this was successfully converted to a continuous numeric (float) data type to allow for accurate statistical aggregations.

Missing Values: Upon converting TotalCharges to numeric, 11 blank values were discovered (representing customers in their first month who had not yet been billed). These nulls were addressed to prevent calculation errors.

Duplicates: The customerID column was evaluated for uniqueness; zero duplicate rows were found in the dataset.

3. Summary Statistics

Tenure: Customers have an average tenure of 32.3 months, with a maximum tenure of 72 months.

Monthly Charges: The average monthly charge is \$64.76, ranging from a minimum of \$18.25 to a maximum of \$118.75.

Total Charges: The average lifetime total charge per customer is \$2,279.73.
